AWS • ELASTIC LOAD BALANCING • LAB

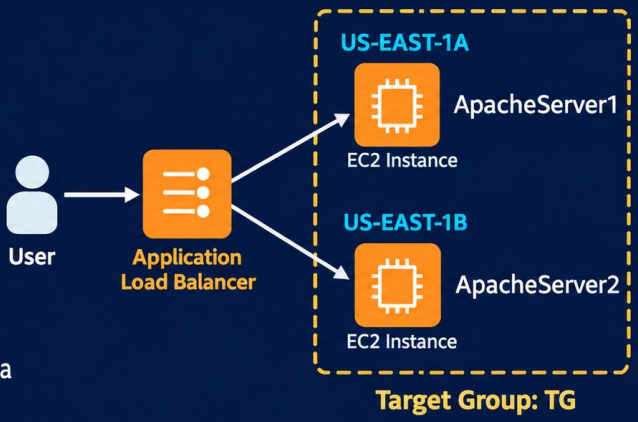

Lab: Application Load Balancer

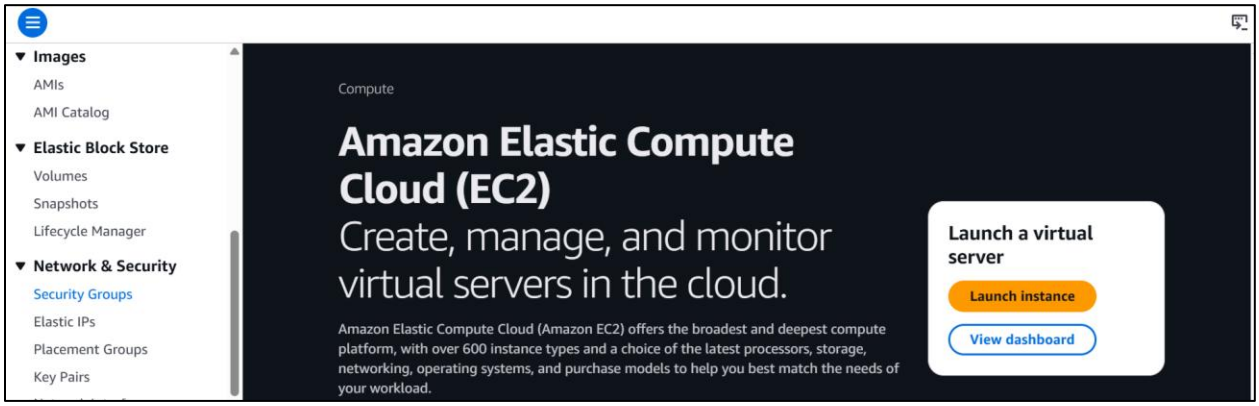

Task A

- Create 2 x Apache servers on Linux (via **user data**) in us-east-1a and us-east-1b.
- Create an **Application Load Balancer** and register both EC2 Apache servers.
- Verify traffic is balanced across both.

Task B

- Block direct access to the servers (tighten **Security Groups**) so they are reachable only via the ALB.
- Verify the servers respond only through the ALB.

Details

Security group name	Security group ID	Description	VPC ID
